Applied Mathematics master's student with a dual background in Mathematics and Physics and training in statistical learning and scientific computing. Experience analysing clinical data, developing numerical simulations, and defining AI and data workflows for a European pharmacy technology provider. Seeking a research or applied ML internship in healthcare or biomedical research.

EDUCATION

Sorbonne University 2025-2026
Master 1 in Applied Mathematics - Advanced Data Science Track
Advanced Probability · Computational Statistics and Machine Learning · Advanced High-Dimensional Statistics · Foundations of Data Analysis · Optimization · Functional Analysis · C++
Planned continuation: Master 2 MS2A at Sorbonne after the gap year.

Sorbonne University 2022-2025
Dual Bachelor's Degree in Mathematics and Physics

RESEARCH AND APPLIED EXPERIENCE

Founder Wots AI May 2025-Present
- Designed AI and data architectures for use cases involving complex and sensitive data.
- Led technical scoping for a European pharmacy technology provider, defining ingestion, canonicalization, anonymization, and evaluation workflows for an AI assistant.
- Translated operational requirements into technical specifications, prototypes, and validation plans.

Freelance Data Analyst Independent May-Sept. 2025
- Prepared and analysed confidential clinical and laboratory data for a preterm-birth risk assessment project.
- Compared predictive models and investigated informative variables using feature importance and interpretability methods.

Research Intern Meudon Observatory Summer 2023
- Developed numerical N-body simulations in Python and analysed their consistency with observational data.

SELECTED PROJECTS

Predictive Modelling of Medical Data Python · Scikit-learn · XGBoost
Investigated clinical and lifestyle factors associated with preterm-birth risk. Performed preprocessing, feature engineering, classification, and cross-validation; used SHAP and permutation importance. Public demonstration uses synthetic data.

Medical Imaging Anomaly Detection Methodology design
Designed a framework for detecting and localizing anomalies using healthy images, considering PatchCore and autoencoders; defined image-, pixel-, and anomaly-level evaluation metrics.

Financial Time-Series Modelling Python · Scikit-learn · C++
Developed regression models with feature engineering and comparative performance analysis. Personal project following a two-month quantitative research internship (June-July 2025) involving algorithm development and Monte Carlo simulations in C++.

TECHNICAL SKILLS

Programming	Python · NumPy · Pandas · Scikit-learn · XGBoost · TensorFlow/Keras · C++ · SQL · Git · Jupyter
Statistics and ML	Regression · Classification · Time series · Feature engineering · Cross-validation · Model evaluation · SHAP · Permutation importance
Scientific Computing	Numerical simulation · Monte Carlo methods · Optimization · Statistical modelling · Data preprocessing · Visualization

ADDITIONAL INFORMATION

Languages	French - Fluent · English - Fluent · Russian - Native
Interests	Biomedical AI · Clinical data · Scientific computing
Sports	Brazilian Jiu-Jitsu · Volleyball · Chess
